

## Project Design Phase-II Technology Stack (Architecture & Stack)

Date	03 October 2022
Team ID	PNT2022TMID35179
Project Name	Predicting the energy output of wind turbine based on weather condition
Maximum Marks	4 Marks

### Technical Architecture:

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

**Table-1 : Components & Technologies:**

S.No	Component	Description	Technology
1.	User Interface	How user interacts with application to know about the services provided	HTML, CSS
2.	Weather Data Collector	Collects real time weather data in the environment	Sensors and networks
3.	ML Model	Symbolic Regression Logic to deal with different parameters	Genetic programming data modeler
4.	File Storage	To store the data files for future reference	IBM Cloud storage
5.	Database	Used to store collected weather data and energy outputs	MySQL
6.	External API	Application programming interface used to know about energy output based on weather conditions	Weather conditions and energy output
7.	Infrastructure(Server/cloud)	Whole system is stored in server for easy access	IBM Block Storage or IBM Cloud storage

**Table-2: Application Characteristics:**

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	Flask	Python
2.	Security Implementations	Data is encrypted when shared with industries so third parties cannot access it.	SHA-256, Encryptions, IAM Controls, OWASP etc.
3.	Scalable Architecture	Middleware is used for communication between client and server	3 tier architecture
4.	Availability	Handles traffic so the system is available for users at all times (e.g. use of load balancers, distributed servers etc.)	Network traffic analysis tools
5.	Performance	Can handle high number of requests. Uses cache for faster retrieval of data.	Confusion matrix, F1 Score, Precision-Recall Curve
